Frequently Asked Medical Microbiology Questions and Answers

1. What are the main features of Gram-positive bacteria?

Answer: Gram-positive bacteria are characterized by a thick peptidoglycan cell wall that retains crystal violet stain during Gram staining, appearing purple under microscopy. They lack an outer membrane and are often more susceptible to antibiotics like penicillin. Examples include Staphylococcus aureus, Streptococcus pyogenes, and Bacillus anthracis.

2. How does the Gram stain differentiate bacteria?

Answer: The Gram stain differentiates bacteria based on cell wall properties: - Gram-positive bacteria: retain crystal violet stain, appearing purple. - Gram-negative bacteria: do not retain crystal violet; they are counterstained pink with safranin due to their thinner peptidoglycan layer and outer membrane.

3. What is the significance of the acid-fast stain?

Answer: The acid-fast stain is used to identify Mycobacterium species, like M. tuberculosis. These bacteria have mycolic acids in their cell walls, which resist decolorization by acid-alcohol, allowing them to retain the primary stain (carbol fuchsin). This is crucial for diagnosing tuberculosis.
