Applications: - Identifying complex chromosomal rearrangements - Precise characterization of

translocations - Cancer cytogenetics Advantages: - Comprehensive chromosomal analysis - Enhanced detection of cryptic rearrangements

4. Multiplex Ligation-dependent Probe Amplification (MLPA)

MLPA allows for the detection of CNVs in specific gene regions. Principle: Probes hybridize adjacent to target sequences; ligation and PCR amplification follow. The quantity of amplified product reflects the copy number. Applications: - Detecting deletions or duplications in specific genes - Genetic testing for inherited disorders - Cancer research Advantages: - High throughput - Cost-effective - Can analyze multiple targets simultaneously

5. Next-Generation Sequencing (NGS) in Cytogenetics

NGS provides high-resolution analysis of the genome. Principle: Massively parallel sequencing of DNA fragments allows detection of structural variants, CNVs, and single nucleotide variants. Applications: - Whole-genome sequencing - Targeted gene panels - Structural variant detection Advantages: - Ultra-high resolution - Comprehensive genomic profiling - Suitable for complex cases

Introduction to Molecular Cytogenetics

Molecular cytogenetics is an interdisciplinary field combining molecular biology and cytogenetics to analyze chromosomal structures and gene localization at the molecular level. It bridges the gap between classical cytogenetics, which relies on microscopy and banding techniques, and molecular methods that provide detailed genetic information. Educational PPTs serve as vital tools for conveying complex concepts, protocols, and technological innovations within this field. They support training sessions, workshops, and academic courses, providing structured, visual explanations of various techniques.

Core Techniques in Molecular Cytogenetics Presented in PPTs

The primary techniques covered in most educational PPTs include: - Fluorescence In Situ Hybridization (FISH) - Comparative Genomic Hybridization (CGH) and Array CGH - Spectral Karyotyping (SKY) and Multicolor FISH (mFISH) - Quantitative Fluorescence PCR (QF-PCR) - Next-Generation Sequencing (NGS)-Based Cytogenetics - Digital Karyotyping and Optical Mapping Each of these methods offers unique insights into chromosomal and genetic alterations, and their presentations typically include diagrams, protocol steps, case studies, and comparative analyses.

Fluorescence In Situ Hybridization (FISH)

Principle and Methodology
