The goal is to produce realistic or stylized visuals that communicate ideas, entertain, or facilitate interaction.

Historical Perspective

Understanding the evolution of computer graphics helps contextualize current technologies. Starting from simple wireframes and raster displays, the field has advanced to sophisticated 3D modeling, real-time rendering, and virtual reality. The Fundamentals of Computer Graphics 5th traces this progression, highlighting key milestones and technological breakthroughs.

Core Concepts in Computer Graphics

Graphics Pipeline

The graphics pipeline is a sequence of steps used to transform 3D models into 2D images for display. It consists of stages such as:

1. Modeling
2. Transformation
3. Lighting
4. Projection
5. Rasterization
6. Fragment Processing

Understanding each stage is vital for optimizing rendering and creating realistic visuals.

Coordinate Systems and Transformations

Computer graphics relies heavily on coordinate systems:

1. Model Coordinates: Local to the object
2. World Coordinates: Scene-wide positioning
3. View Coordinates: Camera perspective
4. Screen Coordinates: Final display pixels

Transformations—translation, scaling, rotation—are used to position and manipulate objects within these coordinate systems, enabling complex scene construction.

Graphics Primitives and Data Structures

Basic Primitives

The building blocks of graphics are primitive shapes:

1. Points
2. Lines
3. Polygons (especially triangles)

Triangles are fundamental because they are easy to render and manipulate mathematically.

The Fundamentals of Computer Graphics 5th discusses hybrid approaches that blend rasterization and ray tracing for efficiency.

Shading Models

Shading models determine how surfaces appear under lighting:

1. Flat shading
2. Gouraud shading
3. Phong shading

These models simulate how light interacts with surfaces to produce realistic effects.

Lighting and Materials

Lighting Models

Lighting significantly affects scene realism. Common models include:

1. Ambient lighting
2. Diffuse lighting
3. Specular highlights

These simulate the different ways surfaces respond to light sources.

Material Properties

Materials define how objects reflect light:

1. Color
2. Shininess
3. Transparency

Understanding material properties is key to achieving desired visual effects.

3D Modeling and Animation

Modeling Techniques

Creating 3D models involves various approaches:

1. Polygonal modeling
2. NURBS (Non-Uniform Rational B-Splines)
3. Procedural modeling

Each method has advantages depending on the application's needs.

Animation Principles

Animation brings static models to life through:

1. Keyframing
2. Inverse kinematics
